Logistic  
Systems

### Preventive Maintenance

It consists of regular, scheduled inspections of equipment and logistics systems to identify and address any potential problems before they turn into costly breakdowns. This helps ensure optimal performance and minimises downtime.

### Corrective maintenance

It involves quick and effective interventions to resolve any failure or malfunction that may affect the performance of clients' logistics systems. The goal is to restore functionality as quickly as possible and minimize any adverse impact on operations.

### Technical Audits

An essential activity that ensures all critical automated systems are fault-free and operating optimally. We advise you on the best solutions for your warehouse.

### Safety inspections

Our team of service engineers adds value by ensuring the safety of workers and equipment. These inspections range from the safety of lifeline systems, racks, ladders and perimeter fences to regulatory compliance.

### Sale and management of spare parts

We supply spare parts for your equipment, ensuring that the materials necessary for facility maintenance are available when and where our customers need them to avoid production downtime or worn out equipment parts.

### Retrofitting

Efficient supply chains require robust, up-to-date systems that ensure peak performance and support future demands and growth. We offer a full range of upgrade and modernisation solutions.
